

# Distributed Quantum Error Correction

First International Conference on Quantum Error Correction

December 19, 2007

Rodney Van Meter (Keio) [rdv@sfc.wide.ad.jp](mailto:rdv@sfc.wide.ad.jp)

Jacob M. Taylor (MIT),

Liang Jiang (Harvard)

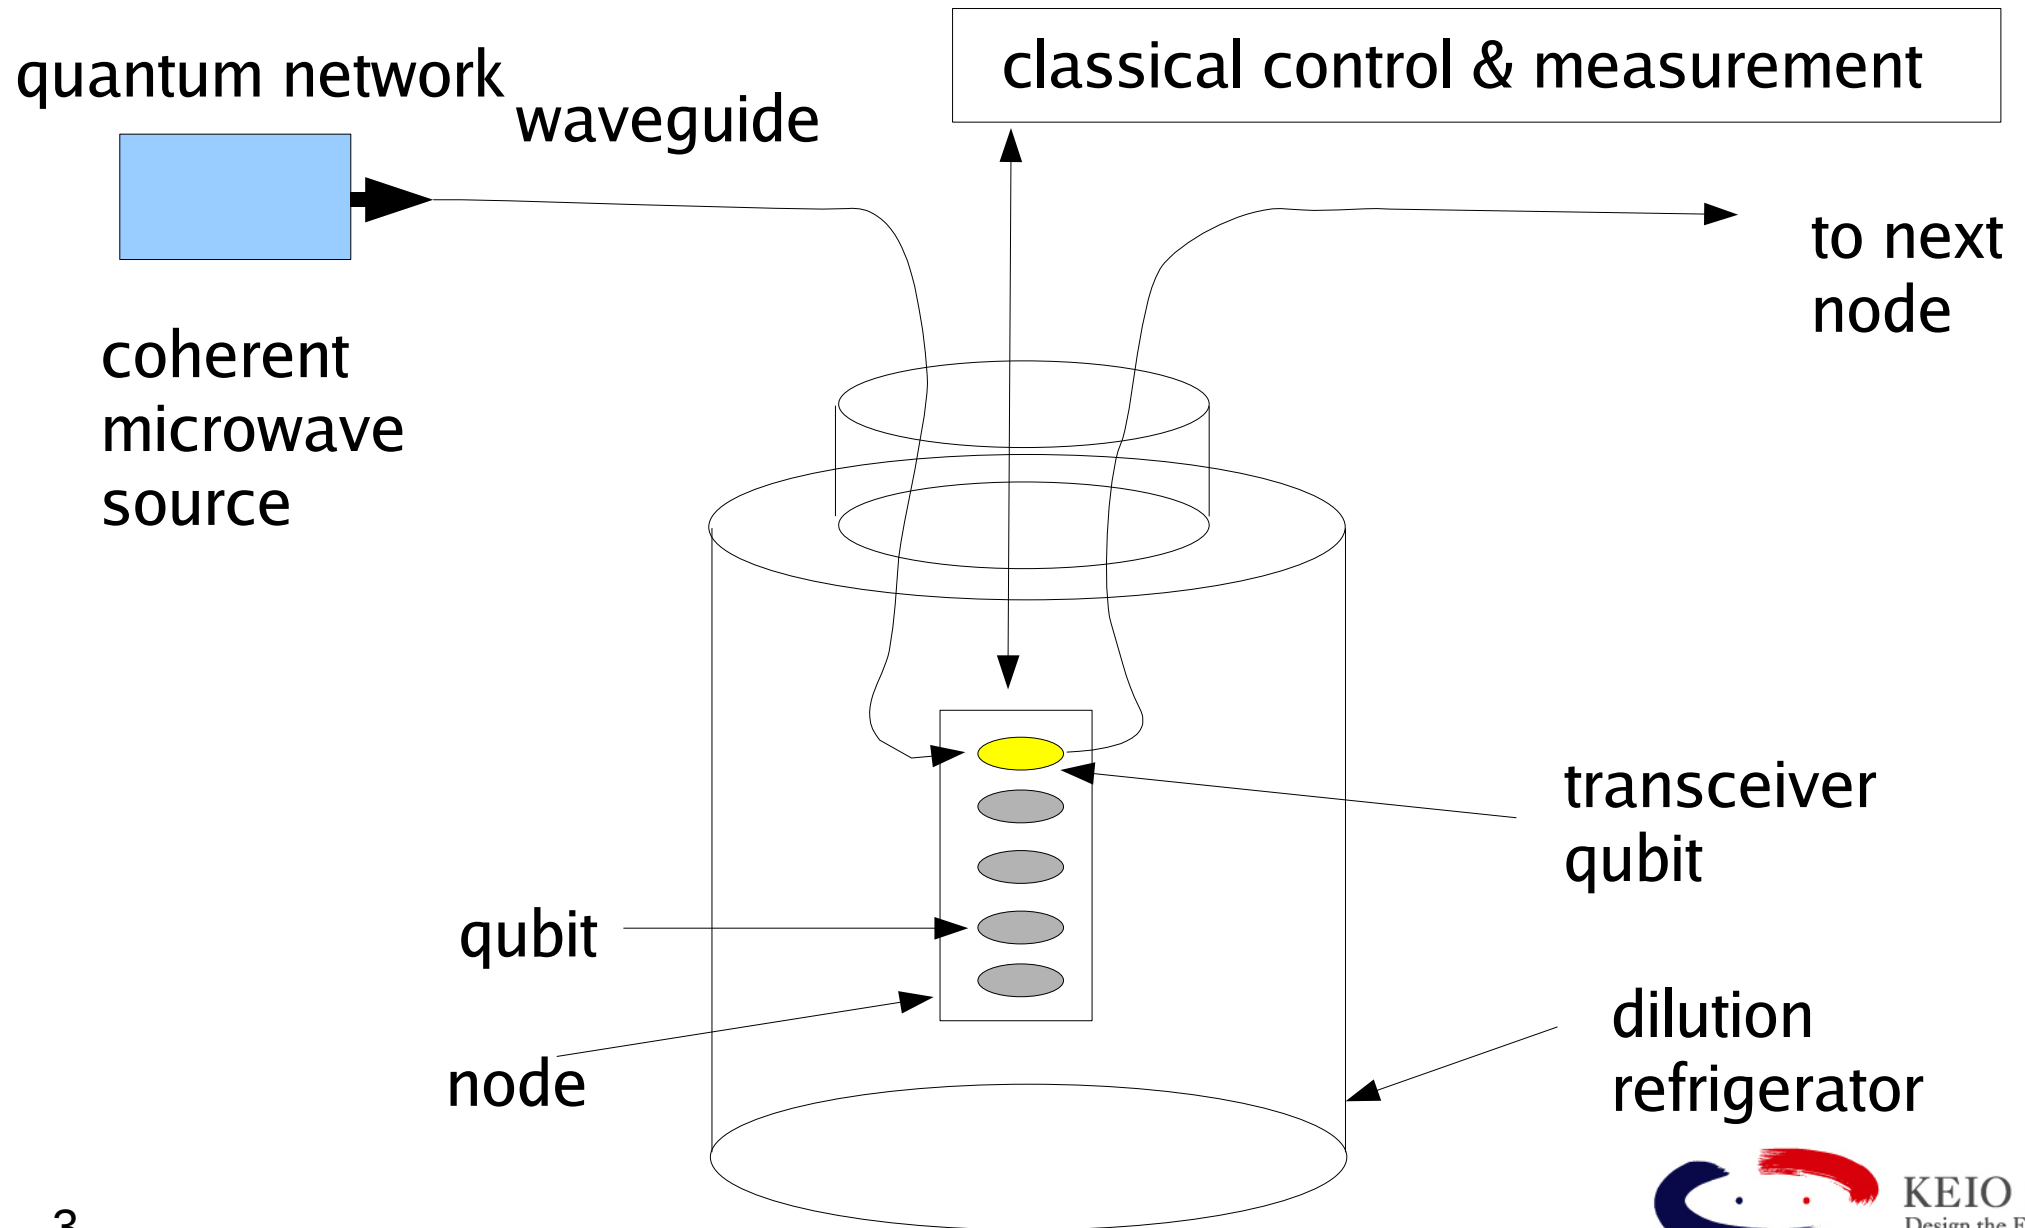

KEIO 150  
Design the Future

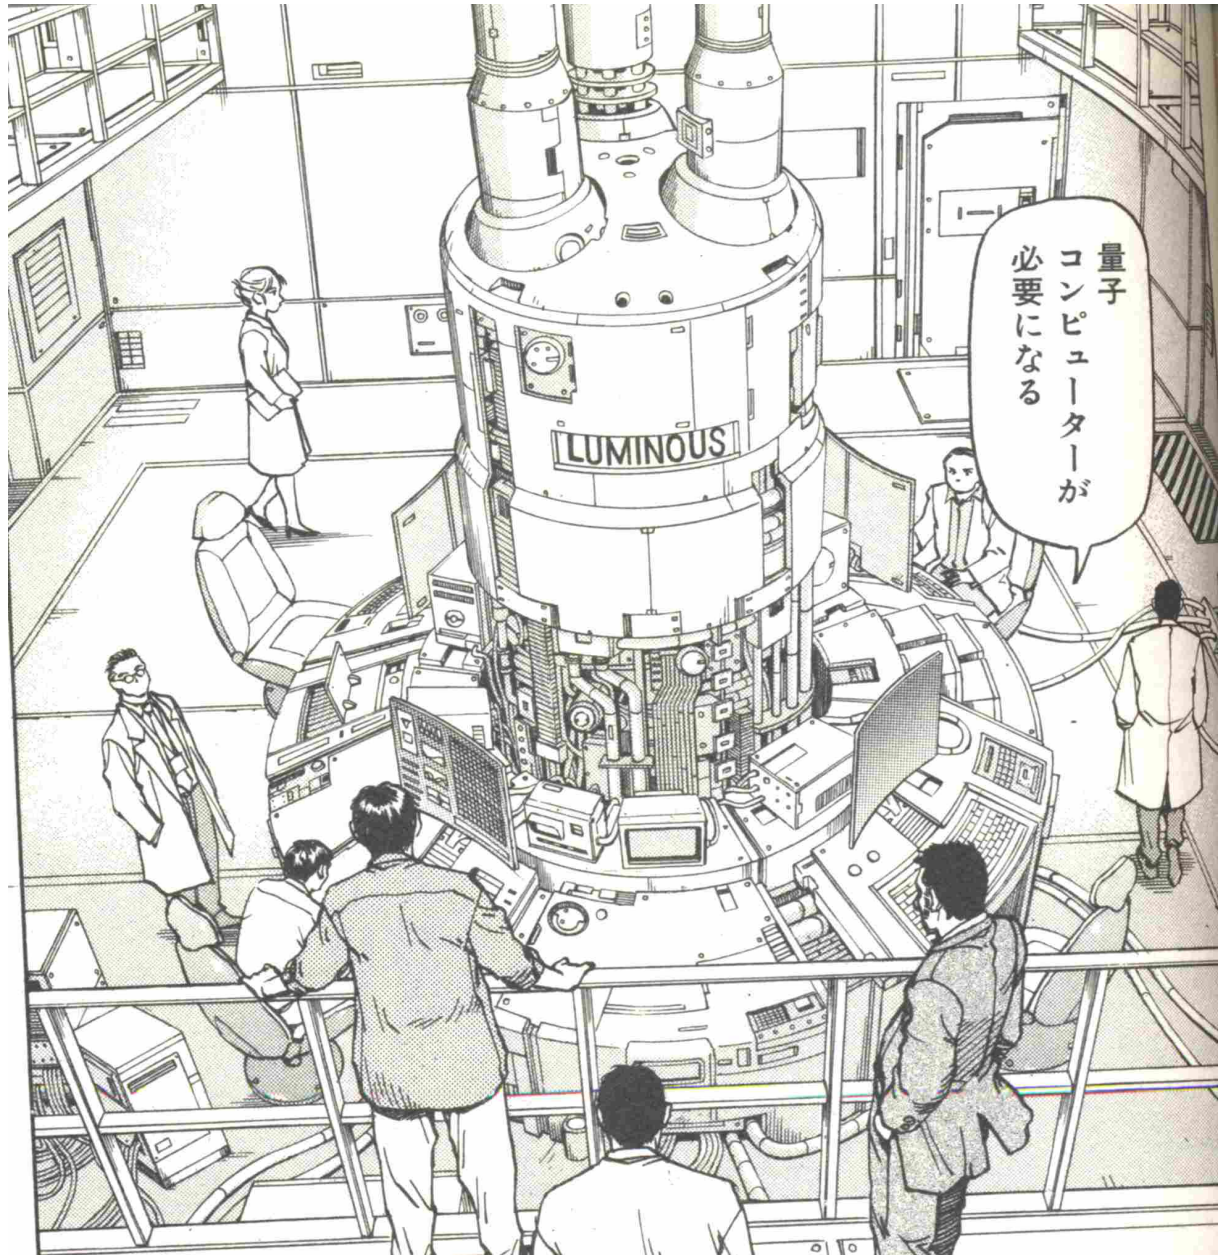

I don't care about quantum error correction.

I care about *quantum computer system architectures*.

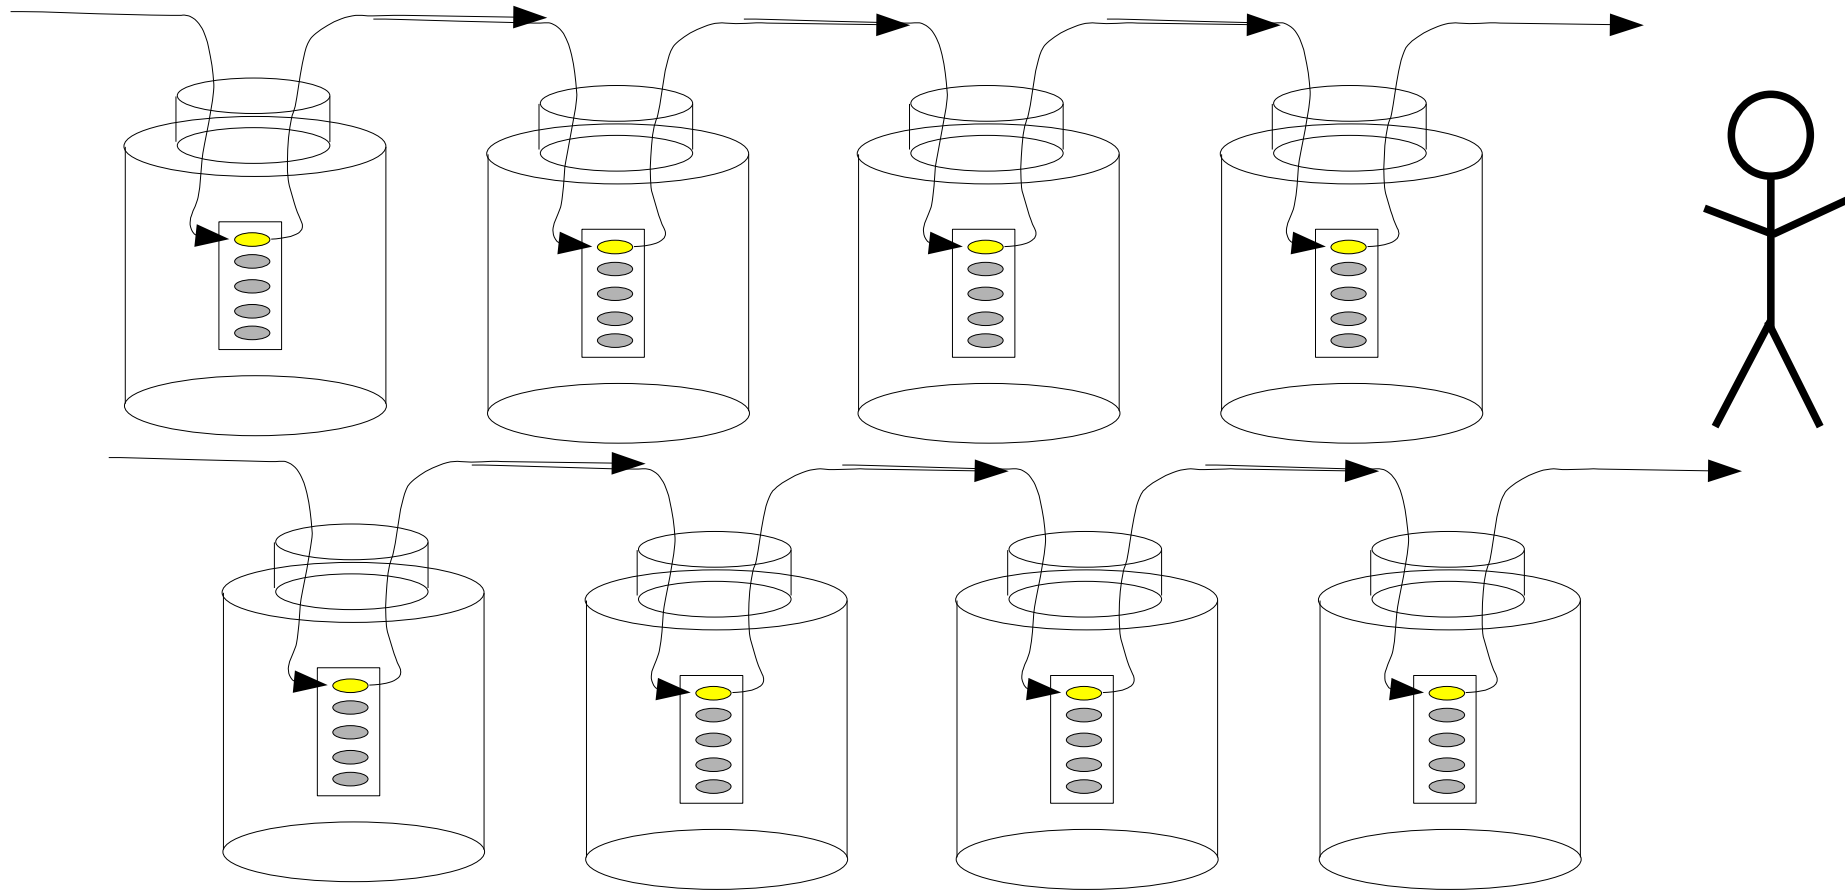

# A Quantum Multicomputer Node

# One Like This?

# A Quantum Multicomputer

# Multicomputer Research

- Architecture:  
# of nodes? Qubits/node?  
**Network topology?** Link design?
- Software: applications, language design
- **Error management:**  
**Quantum Error Correction (QEC),  
purification for teleportation**
- Performance analysis

rdv, WJM, KN, KMI, Proc. Int. Symp. Computer Architecture (ISCA) (2006)

J. Emerging Tech. in Computing Systems (2007)

KEIO 150  
Design the Future

# Link Design

# Link Design

- Two levels of  $[[23,1,7]]$  code allow 1% physical teleportation failure when factoring a 1024-bit number
- Serial links work well when memory error rate 100x better than teleportation
  - Preferable for engineering reasons
- *Creating and using distributed logical zeros is painful and unlikely to work well.*

rdv, KN, WJM, IEEE Trans. on Computers, 56(12), 2007

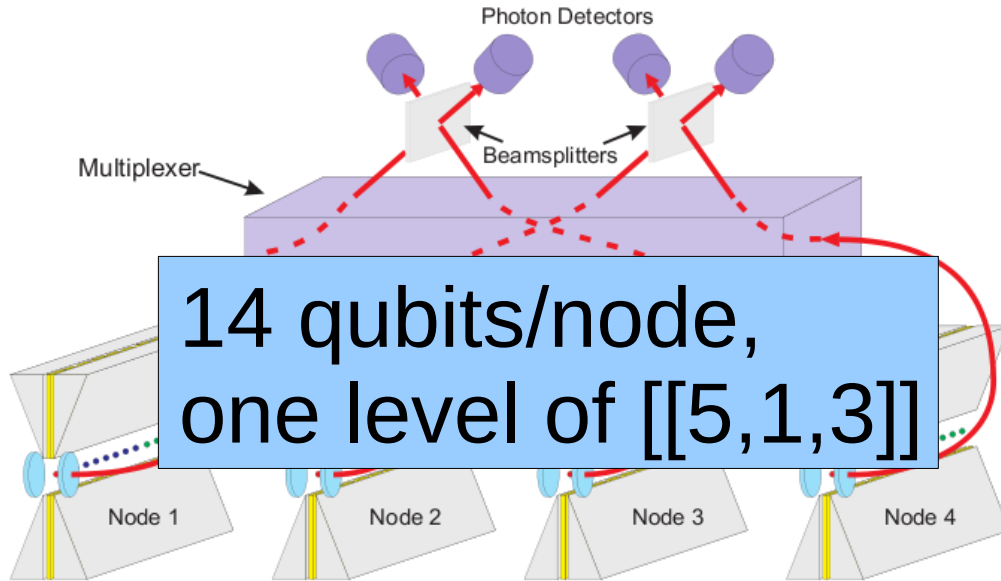

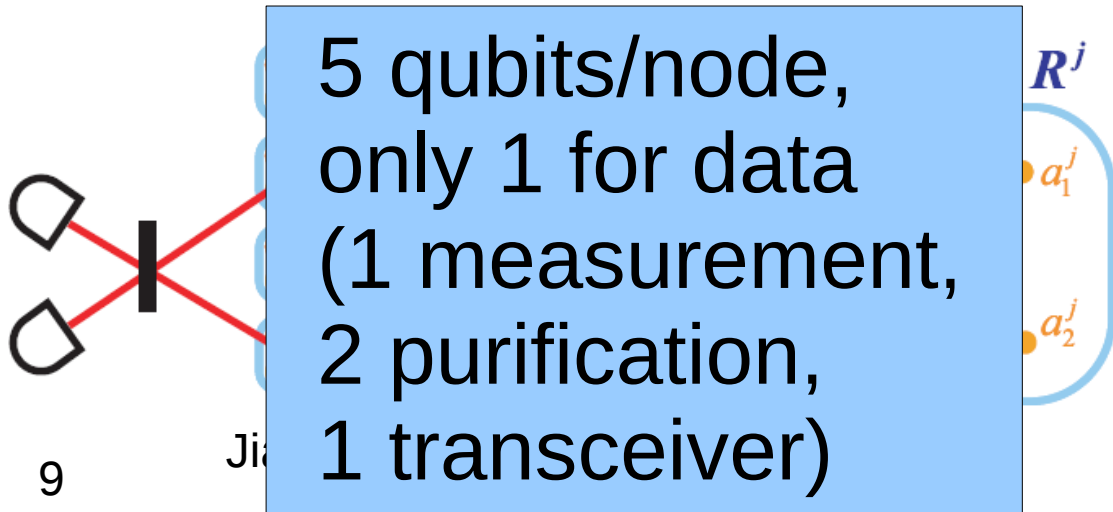

# Small Nodes

Oi, Devitt, Hollenberg, PRA 74

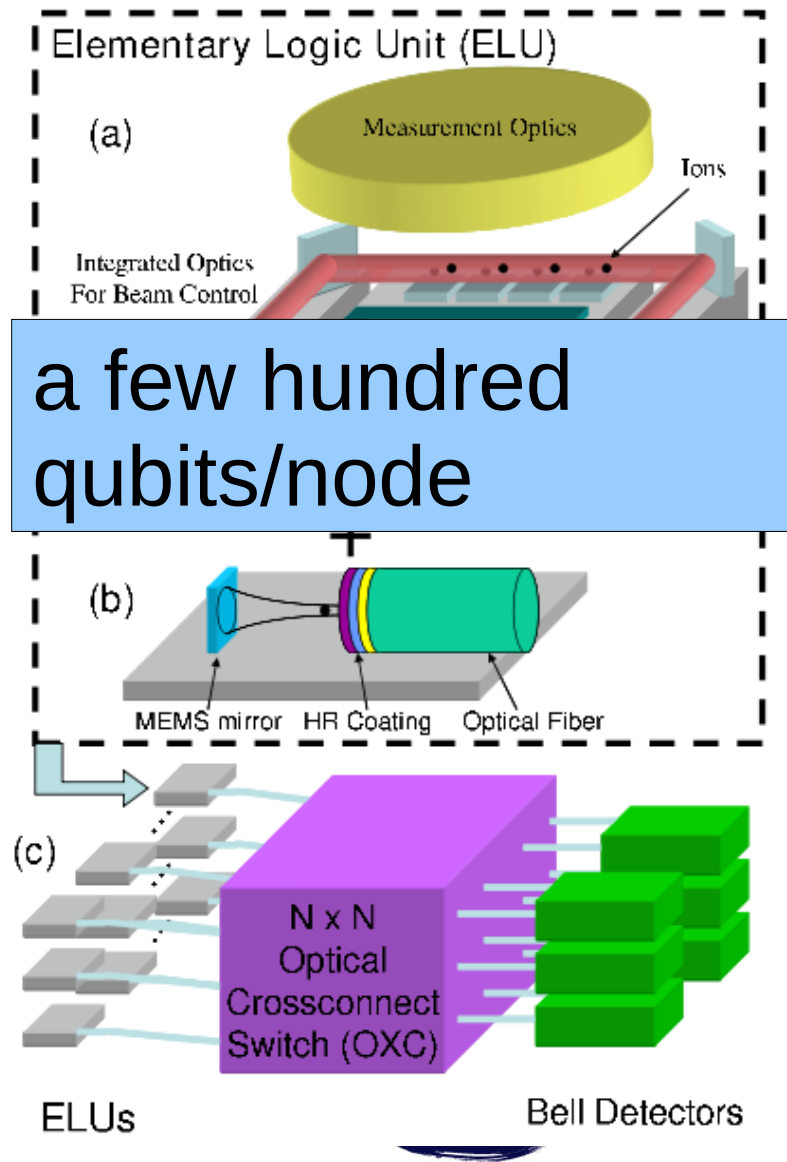

14 qubits/node,  
one level of  $[[5,1,3]]$

5 qubits/node,  
only 1 for data  
(1 measurement,  
2 purification,  
1 transceiver)

Kim & Kim, arxiv:0711.3866

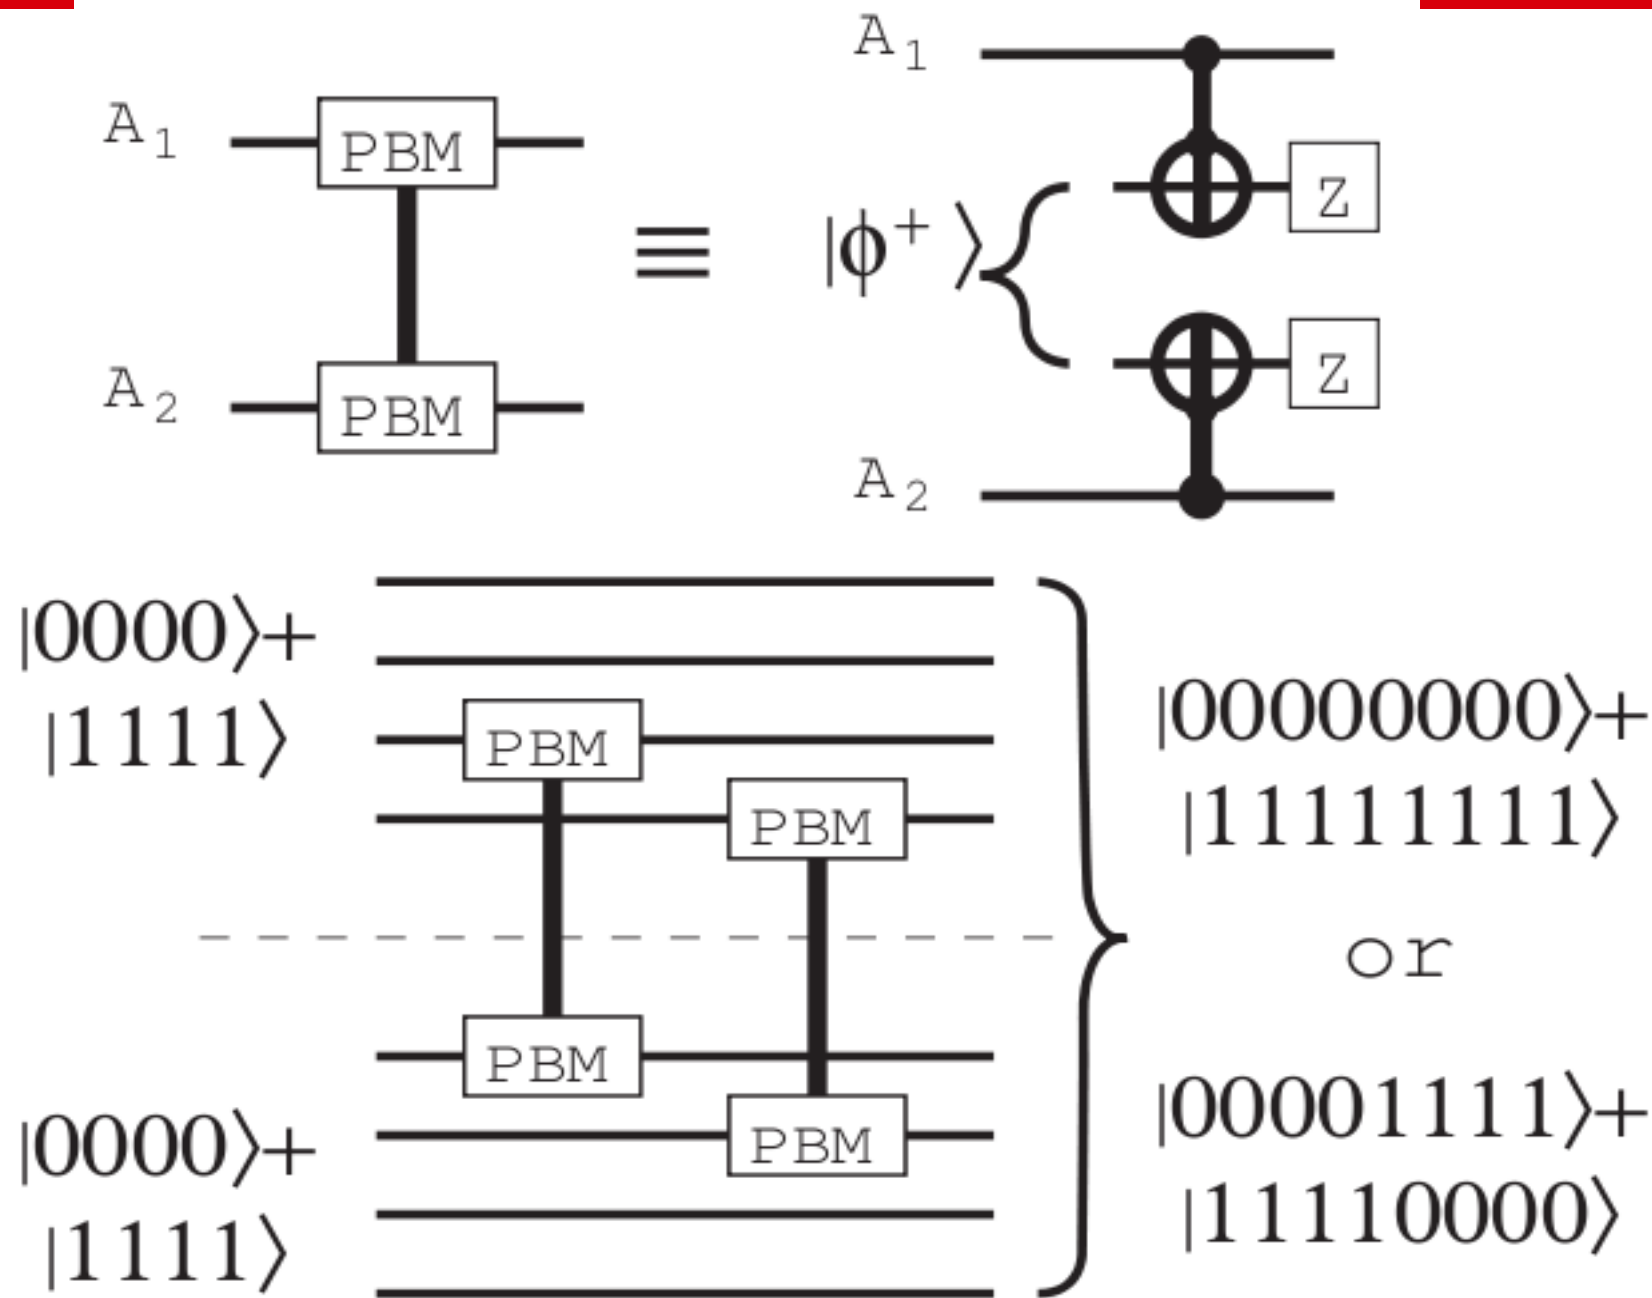

# Small Nodes

- Many technologies support small nodes, not the 3-5 thousand physical qubits we want
- At first glance, teleportation failure rates must meet standard threshold arguments

# Partial Bell Measurement

# [[9,1,3]] Shor Code Stabilizer

```

X X X X X X I I I I I I
X X X           X X X
I I I           X X X
    
```

```

Z Z I II IZ IZ I II II I I I I I I I I I I
I I I I I I Z Z I I Z Z I I I I I I I I
I I I I I I I I I I I I Z Z I I Z Z
    
```

# Shor Stabilizer in 3 Nodes

2 Bell pairs

+ 2 Bell pairs = 4 Bell pairs

for one round of level one QEC

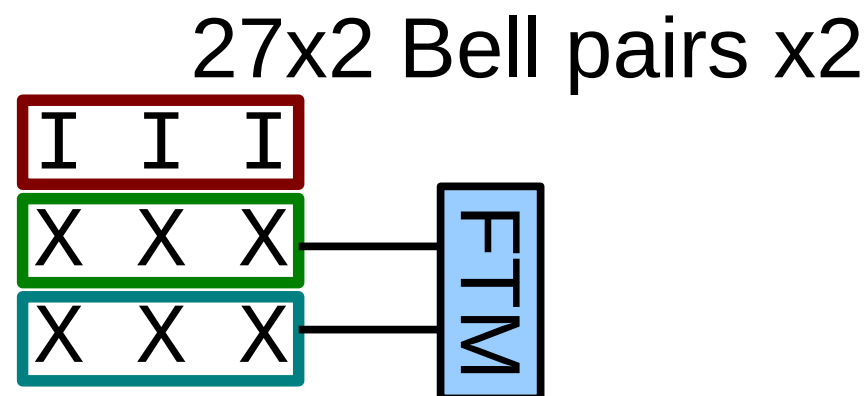

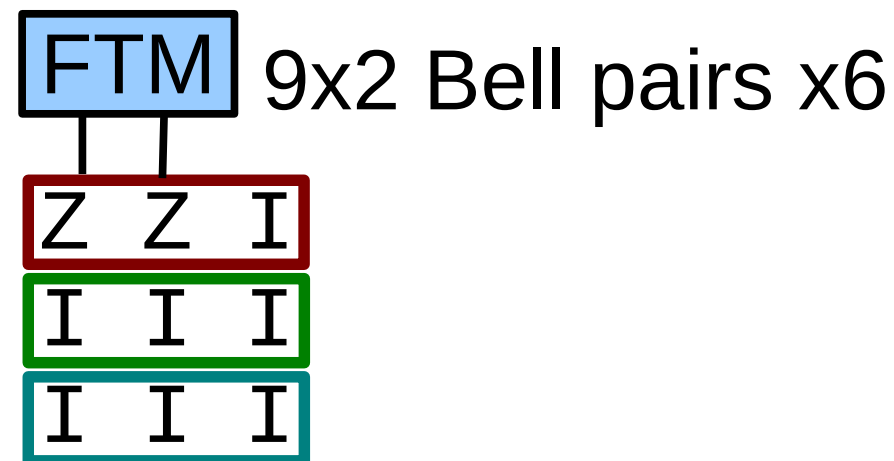

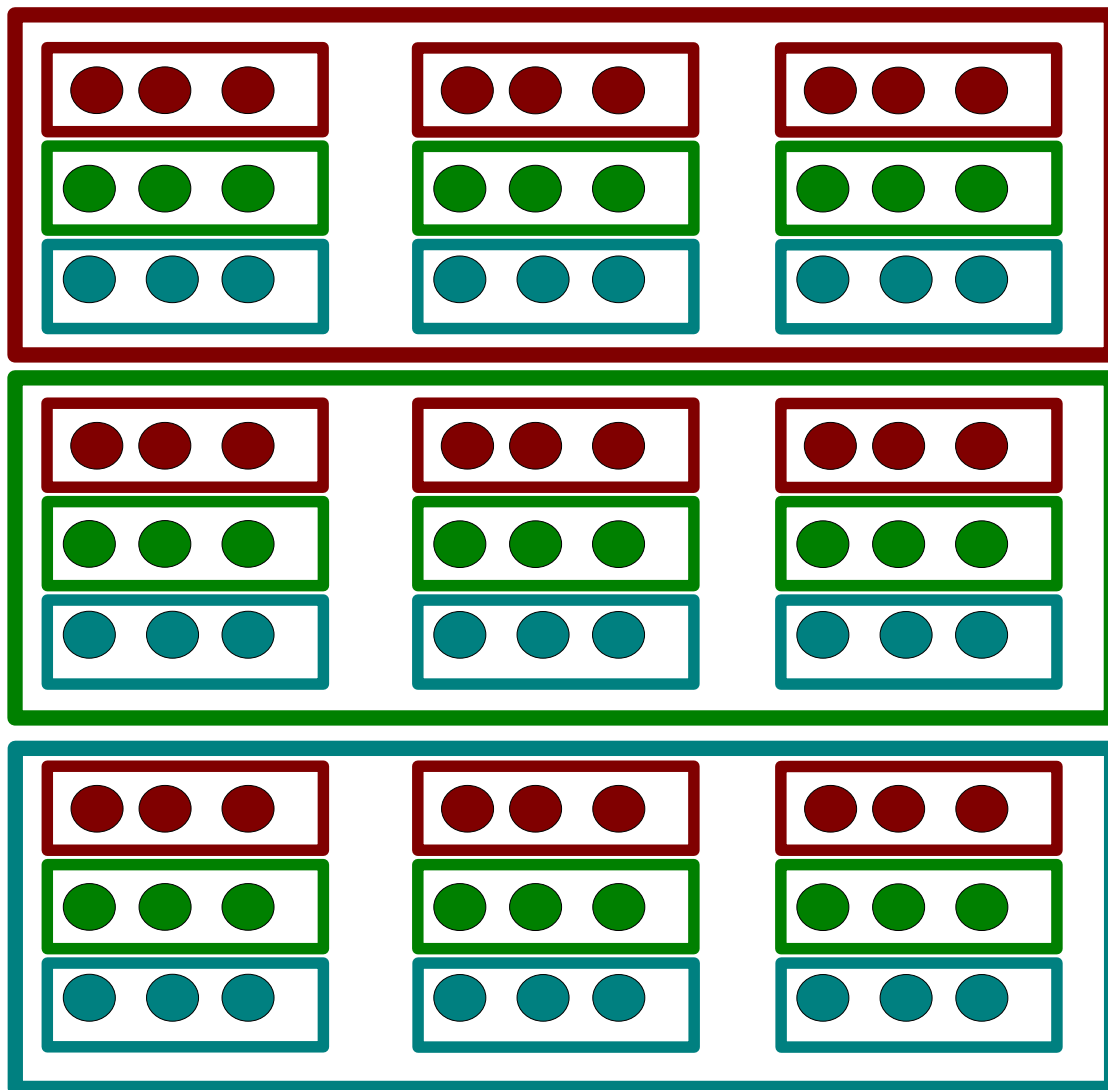

PBM uses one  $|000000\rangle + |111111\rangle$ , built & verified using two Bell pairs

Zero Bell pairs consumed!

PBM = Partial Bell Measurement

# Concatenation

<sub>14</sub> FTM = Full Transversal Measurement

KEIO 150  
Design the Future

# [[9,1,3]]x[[9,1,3]]

- Single-data-qubit (5 phy qubit) nodes require  $(5+6) \times 2 \times 9 + 9 \times 2 \times 6 + 27 \times 2 \times 2 = 414$  physical Bell pairs
- 3-data-qubit nodes (9 phy) require  $4 \times 9 + 9 \times 2 \times 6 + 27 \times 2 \times 2 = 252$  physical Bell pairs
  - ~1.6x for scaleup 5-->9 physical qubits/node
- 9-data-qubit nodes (20 phy) require  $9 \times 2 \times 6 + 27 \times 2 \times 2 = 216$  physical Bell pairs
  - but first level QEC will cycle faster
- Plus 81 Bell pairs per logical gate or teleportation

# Observations

- All codes require entanglement btw nodes
  - Some syndromes purely local, some “hard”
- Mitigation approaches:
  - match to error type (biased error model)
  - reduce frequency in “hard” direction
  - relax constraints: Bacon-Shor?
- For detailed performance calculation, need to separate Bell pair creation from actual teleportation

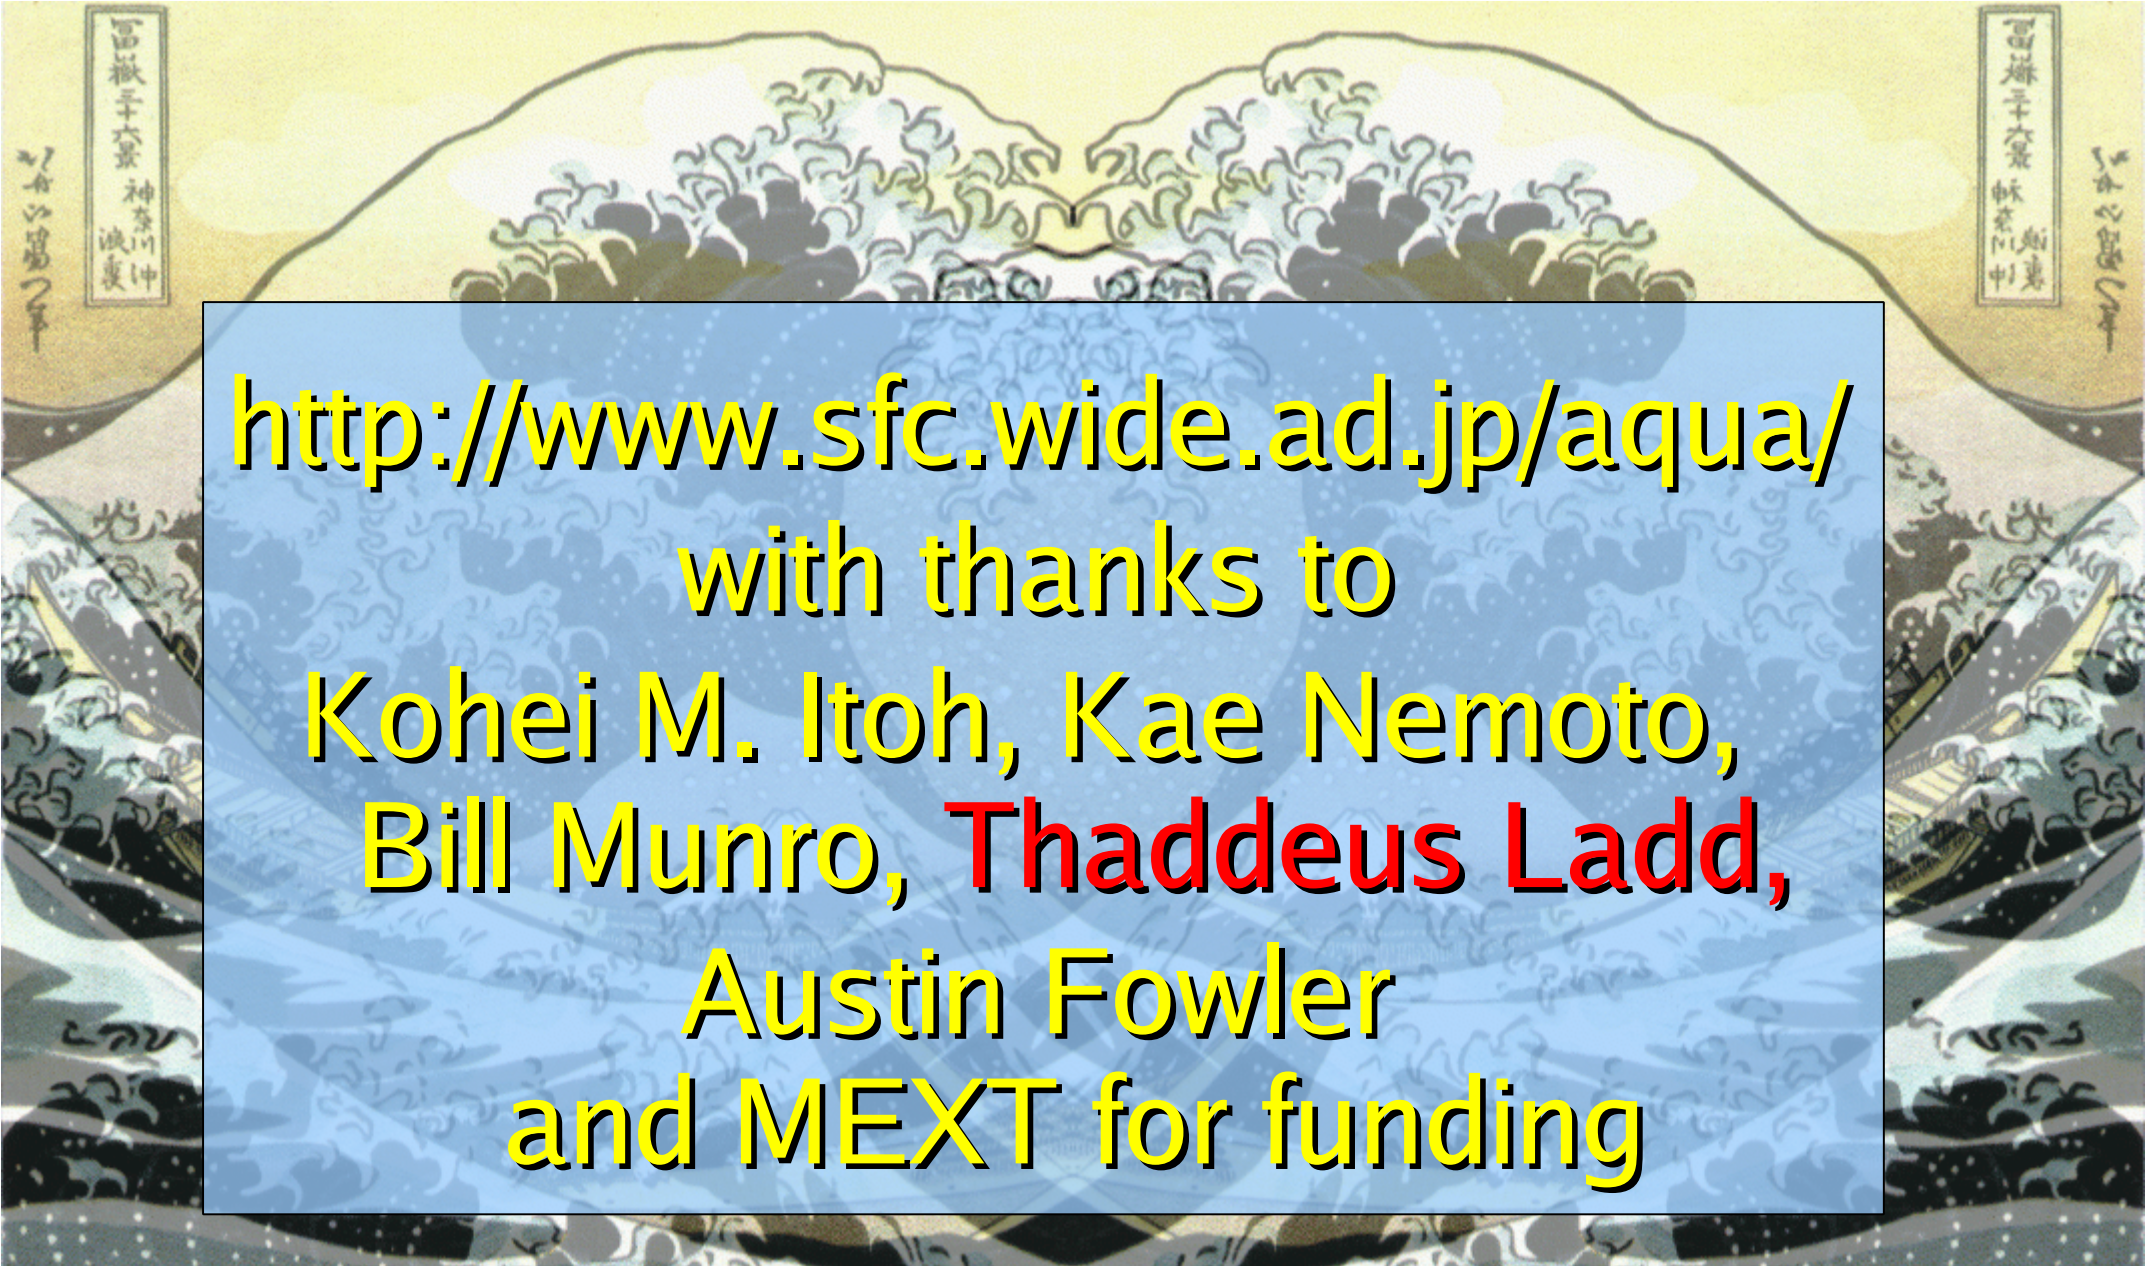

# Conclusions

- Small nodes not ideal, but usable
  - full logical qubits/node much better (how much depends on ratio of logical gates to QEC)
- At second level and above, the *interconnect* remains teleportation

# AQUA: Advancing Quantum Architecture
